Epi Info software Genre DeveloperCenters Disease Control and Prevention Data First Version1985 Latest version7.2 (June 27, 2016) Operating systemMicrosoft WindowsAndroidiOS LanguageC# Domain Public License (free license) site webwww.cdc.gov/epiinfo/index.html and www.cdc.gov/epiinfo/ Edit data Wikidata · Epi Info Guide for Italian Epi Info is a national domain statistical software created by the Centers for Disease Control and Prevention (CDC) in Atlanta (USA) and distributed in an active world to make available practices and methods of epidemiology. Epi Info has been around for over 20 years and is continuously updated for compatibility with Microsoft Windows. The programme is a unanimous flexible and versatile tool for carrying out epidemiological surveys in this area, collecting health data and carrying out analyses of any health database. The software is free and can be picked up from both the CDC website and the Italian language, the Info of The Italian Epi Info Since 1998 has increased from over 2,000,000 downloads in 180 countries around the world. The historical background of the first version, Epi Info 1, was originally used with MS-DOS 5.25 and was released in 1985. MS-DOS is still the only supported operating system that could be used to run the program. Epi Info 2000 was written in Microsoft Visual Basic and became the first version of a Windows-compatible program. The latest version of MS-DOS was epi info 6.04d, released in January 2001. Epi Info 2000 changed the way data was saved and processed automatically using the Microsoft Access database format instead of continuing to use the MS-DOS plain text file format. Later, Epi Info 2000, epi info 2002 followed, and finally Epi Info 3.0 (2004). The latest epi info version of Windows 98/NT 4.0/2000/XP/Vista is 3.5.1, released in August 2008. In Epi Info this one of the most important features of Epi Info is the speed of creating a questionnaire, creating a data collection process, quickly entering data in the created questionnaire, and analyzing the data. For epidemiological purposes, as well as for the purposes of the field of epidemiological inquiry, an electronic data collection mask can be quickly established and a rapid analysis of the data collected can be carried out, saving considerable time compared to a survey carried out with paper material. Epi Info uses three different modules to perform these functions: MakeView, Enter, and Analysis. There are other programs such as: Epimap, which allows geographical representation of EpiReport data to create more detailed reports than those created with nststat analysis functions used by pediatricians for malnutrition in developing countries Statcalc, statistical calculator how to mask inserting calls are created in the MakeView form. You can insert individual questions into appropriate fields, place them on the screen, and then cross multiple pages. The user can define the question for the header and the format of the data that you entered. The data type includes numbers, text, dates, times, yes/no answers etc... Users can also create drop-down curtains, encoded pages and comment fields, and check boxes. One of the potential of makeview is to create Check Codes. These codes allow you to check the occurrence of events under certain conditions by creating an adaptation of the electronic questionnaire. The analysis module is used to analyze data recorded in an epi info mask. You can import and export data collected in CSV, Microsoft Excel, Microsoft Access, dBase, FoxPro, and other formats. Simple statistical analyses (frequency distribution, averages, percentiles, graphs) may be carried out, providing statistical tests (e.g. confidence intervals, student T-test, ANOVA test, non-euetic statistics) and cross tables and stratifications with indicators such as odds ratio, ral risk and who. In addition, the analysis is able to provide linear and logistical regression (simple and multiple), survival analysis (Kaplan Meier and Cox proportional risk) and complex sample analysis (clusters). The Epi Map module allows you to distribute data displays according to geographical references and GPS coordinates. You can use the EpiReport module to review and reformu formulate information from various Epi Info tools and modules. You can print or directly connect the HTML document that you create to the network, or exchange it with other users. The use of Epi Info allows healthcare professionals to prepare an electronic questionnaire to record the data collected and perform statistical analysis and prepare reports together with the indicators. Epi Info allows you to get closer to data management techniques and become self-sufficient to find answers to your information needs. Epi Info can be used as a tool to read databases of its information systems, in particular to make its quantitative findings available and to exchange the results of epidemiological investigations. Epi Info Epi Info features the possibility to use an autonomous and proprietary technical language based on epidemiology, management and data exchange, thus facilitating the exchange of experience, knowledge and knowledge. The Italian Epi Info network has in recent years been enriched by groups of professionals (MG doctors, neurologists, ingiers, occupational physicians, ericians, quality experts, health directors, etc.) working with Epi Info on the same issues, but each in their field. The Italian Epi Info Association aims to bring knowledge and knowledge closer together by facilitating the exchange of experience through some tools. Epi Info is compatible with several computer tools, such as: Microsoft Access and other SQL or ODBC Visual Basic databases, version 6 of browsers on the World Wide Web, and HTML Extensibility, so that organizations that are not CDC (the owner of the software rights) can create additional modules in the future development, version 7 is currently being developed as an open source project written using the Microsoft programming language. Net. Both Windows and Linux platforms are supported. The source distribution code and contribution are made through Codeplex. Unlike previous versions of Epi Info, however, version 7 comes in one of two areas: CDC Edition and Community Edition. The community edition will be editable to users in general, while the CDC Edition will be reserved for the Epi Info development team. Over time, CDC Edition will include changes and improvements to the Community Edition and put the CDC in an assessment of the software testing process. Cdc approval remains to allow the installation of the U.S. government's Epi Info program on the computer. Epi Info 7 will support MySQL and SQL Server databases as well as traditional Microsoft Access formats. Users will also be able to save metadata separately from the same data, for example, you can leave the questionnaire in an XML file, while the storage of the collected data will take place in the MySQL database. The utility and conversion program will allow projects to be compatible with Epi 3 with version 7. Initially, only the MakeView, Enter, and Data Analysis module will be available with Epi Info 7. EpiMap, Messages, and the ability to edit the menu will be added later. Notes ^ Andrew G. Dean, MD, MPH, Svati P. Shah, MPH, Jeanetta E.
